DETAILED ACTION

This is responsive to Applicant's amendment filed on 7/25/06.

Upon consideration and review of the Applicant's response, all the previous Office action including restriction requirement has been withdrawn and the following rejection has been made. Any inconvenience to Applicant is regretted.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1, 2, 5, 7, 9, 10, 11, 14, 16, and 17 are rejected under 35 U.S.C. 102(b) as being clearly anticipated by Lowry [USPAT 6,418,267].

Lowry discloses an optical device comprising: a plurality of optical fiber arrays 17s [fig. 4B], each optical fiber array having their one ends oriented to receive electromagnetic radiation from free-space [near 19 in fig. 4B] and arranged to transmit the electromagnetic radiation to an array output, and the array outputs are connected to transmit the electromagnetic radiation in sequence to a signal detector input [near 9].

In re claim 2, the optical delay is clearly shown by different length of the optical path in fig. 4B.

Allowable Subject Matter

Claims 3, 4, 6, 8, 12, 13, and 15 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

The following is a statement of reasons for the indication of allowable subject matter: the prior art does not disclose or suggest an electromagnetic signal processing system comprising all the specific components with the specific combination including the array group outputs are connected in series by respective optical delays to the signal detector input as set forth in claim 3; including an array group output of one array group is connected to an input to another array group as set forth in claim 4; and including an optical switch is arranged operatively between the array group outputs and the signal detector input as set forth in claim 6.
